

Kemal Ozturk

SOFTWARE ENGINEER · PRODUCT, PLATFORM & TECHNICAL LEADERSHIP

Wheeling, IL · 97kemalozturk@gmail.com · kozturk.com · linkedin.com/in/ozturkkl · github.com/ozturkkl

PROFESSIONAL SUMMARY

Software engineer with 7 years of experience owning products end to end: system design, RFCs, implementation, staged rollout, and production operations. Trusted as a technical DRI across frontend, APIs, platform services, security, and reliability. Turns ambiguous requirements into durable systems, and uses AI-assisted development to raise delivery velocity without lowering the quality bar.

TECHNICAL SKILLS

Core: TypeScript, JavaScript, React, Angular, Next.js, Redux/Redux-Saga, Node.js, HTML, CSS/SCSS

Media & real time: WebRTC, Daily, MediaRecorder, WebCodecs, WebAssembly, Web Workers, progressive upload and recovery, Electron

Systems & platform: Temporal, REST APIs, GCP, AWS, Firebase, Sentry, LaunchDarkly, Cloudflare, Retool, Nx, Turborepo, Vite, GitHub CI

AI-assisted development: Cursor, Claude Code, Zed, Microsoft Copilot, OpenAI Codex

Additional: Rust, Tokio, Poem/OpenAPI, Svelte, Python, C, C++, Nix/NixOS

PROFESSIONAL EXPERIENCE

Software Engineer

June 2023 – September 2026

Descript

- Led architecture and delivery of Scheduled Rooms across Drive, Rooms, APIs, and the recording stack; took invites from RFC through 100% rollout, then shipped hostless recording to GA and link-based hosting behind a dedicated safety flag, reaching 500+ weekly creations, over 50% conversion, and roughly 25% of Rooms recordings.
- Designed invite-scoped authorization using delegate authentication: slug-based invite links, server side host permission, project-scoped credentials, and isolated sessions so a link-holder can record without project membership; coordinated mixed-version rollouts and security review.
- Architect and first engineer on Descript's Web Recorder platform: a UI-independent TypeScript recorder engine and Redux-Saga orchestration for multi-track camera, microphone, screen, and system audio at 4K/30 FPS, with hot-swappable devices during capture. The package was reused across Editor, Media Library, Quick Recorder, and Rooms.
- Delivered instant playback end to end: a Web Worker upload manager with progressive chunk upload, progress-aware smart timeouts, duplicate upload protection, and recovery handoff. Built instant playback feature so people could play back a take while chunks were still uploading.
- Shipped script-state visualization, cancel/restart, and pre-roll/live playback to GA; improved A/V synchronization from approximately 700 ms to 50. Added a WebAssembly denoise effect that preserves voice character.
- Owned high-stake recording surface, and incidents across web and desktop, data-loss recovery, MediaRecorder container and device failures, authorization and rate-limit paths, memory telemetry, deploy guards that keep local config out of production bundles, and built Support diagnostics tools.

Software Engineer
SquadCast

January 2022 – August 2023

- Built and owned a browser-based remote recording product using Angular, TypeScript, Next.js, Firebase, and GCP, spanning the recording engine, notifications, account lifecycle, integrations, onboarding, scheduling, and authentication.
- Led Canvas and SquadShots releases and introduced dark mode, mobile-first responsive design, accessibility improvements, and reusable UI components.
- Created Nx executors and generators that reduced feature scaffolding from 30 minutes to 5; profiled and fixed CPU usage and memory leaks across Studio, Chat, Dashboard, and audio metering.

Software Engineer
Peel9

August 2019 – September 2021

- Delivered Node.js, Express, and Handlebars features for records management and analytics used by 10+ police departments, including approval workflows, crash diagrams, modular forms, and account recovery.
- Led code reviews, maintained the GitHub repository, mentored junior engineers, and built a Leaflet plugin for dynamic crash-map markers.

SELECTED PROJECTS

Framework Control

2026 – Present

- Built a cross-platform Framework laptop control surface with a Rust service (Tokio, Poem, OpenAPI) and Svelte/Vite UI for live telemetry, fan curves, battery charging, and AMD power controls.
- Shipped Windows MSI and Linux systemd/udev support plus AUR, nixpkgs, and NixOS packaging; solo-maintained project reached 220+ GitHub stars and 7 forks.

Cihan Radyo

Volunteer · Ongoing

- Built and maintains a Svelte/TypeScript PWA for live radio and podcast archives across desktop and mobile, with lock-screen controls, continue-listening, Turkish-aware search, Google Drive sync, and Android TWA packaging released in the Play Store and App Store.
- Serves approximately 1.4K daily unique visitors and handles 334K daily requests through Cloudflare, delivering 20 GB per day with 61% cached.

RGBPiano

2023 – Present

- Built a piano LED visualizer that maps MIDI to LED frames on a TypeScript host, then streams them over WebSocket to a Raspberry Pi Zero driving a WS2812 addressable RGB LED strip, with a Svelte UI for color, mapping, and note envelopes.

EDUCATION

Bachelor of Science, Information Technology
University of Cincinnati

2021 · GPA 3.97/4.0

Coursework toward a Bachelor of Science in Computer Science
Ankara University

2016 – 2018 · GPA 3.83/4.0
